13. ABSTRACT (maximum 200 words) This atlas presents the hydrographic (CTD) data collected during the California Undercurrent (CUC) project, which spanned three years (April 1988 - April 1991) and 19 cruises. The study area consisted primarily of a transection of 22 CTD sites extending offshore from Point Sur, California, to an intersection point with California Cooperative Oceanic Fisheries Investigations (CalCoFi) line 67 and thence along that line to a point approximately 200 km offshore. The study area also included approximately 20 more CTD sites scattered in and about Monterey Bay. The CTD data are presented graphically and in tabular form for selected pressures.

1.0 Introduction

From April 1988 through April 1991, the Naval Postgraduate School (NPS) repeatedly occupied a series of hydrographic stations extending offshore from Point Sur, California (36° 20'N). The intent was to study the temporal and spatial variability of the California Current system, and in particular the California Undercurrent (CUC), at that location.

Generally speaking, the California Current system is comprised of two flow regimes: a broad, weak ($< 25 \text{ cm-s}^{-1}$), equatorward-flowing current (the California Current), and narrow poleward-flowing inshore boundary currents (the California Inshore Current and the California Undercurrent) (Rischmiller, 1993; Reid and Schwartzlose, 1962; Wooster and Reid, 1963; Lynn and Simpson, 1987). The California Undercurrent (CUC) is distinguished from the relatively cool fresh subarctic water of the California Current by its warmer, saltier Equatorial water mass, and has been observed locally at sites ranging from Baja California (Wooster and Jones, 1970) to Vancouver Island (Hickey, 1979). Its continuity, however, has not been established, and it may, in fact, be discontinuous (Tisch, et. al., 1992). Off Point Sur the CUC can be found throughout the year over the continental margin ($\approx 33 \text{ km}$ offshore) at a depth of 350 m and with an average speed of 7.6 cm-s^{-1} (Collins et al., 1996).

The data for this atlas were collected during 19 cruises between April 1988 and April 1991 by the NPS Department of Oceanography. This atlas is intended to show the hydrographic structure off Point Sur, California, and is particularly intended to characterize the CUC in this region. During these 19 cruises related velocity observations using an acoustic dropsonde (Pegasus) were also made. Those data have been examined by Rischmiller (1993).

2.0 Observation Program

In 1987, NPS established the Point Sur Transection (POST) as a location to study the long-term variability of the alongshore currents of the CUC. The POST extended offshore due west from Point Sur and perpendicularly across Sur Ridge to intercept the California Cooperative Oceanic Fisheries Investigations (CalCoFi) line 67, which it then followed to a point approximately 200 km offshore (Figure 1a). This area had the advantage of being near NPS, yet without the complication of the complex topography of the Monterey Submarine Canyon (over which the inshore part of CalCoFi line 67 tracks). The 19 cruises from which the data for this atlas were collected followed the POST (Figure 1a), and were completed on an approximately bi-monthly schedule from April 1988 to April 1991 (Table E2). In April 1988, the first cruise aboard the USNS DeSteiguer established the station locations for the program. Subsequent cruises in the program aboard both the R/V

Figure 1a. The Point Sur Transection (POST), with CUC CTD station sites.

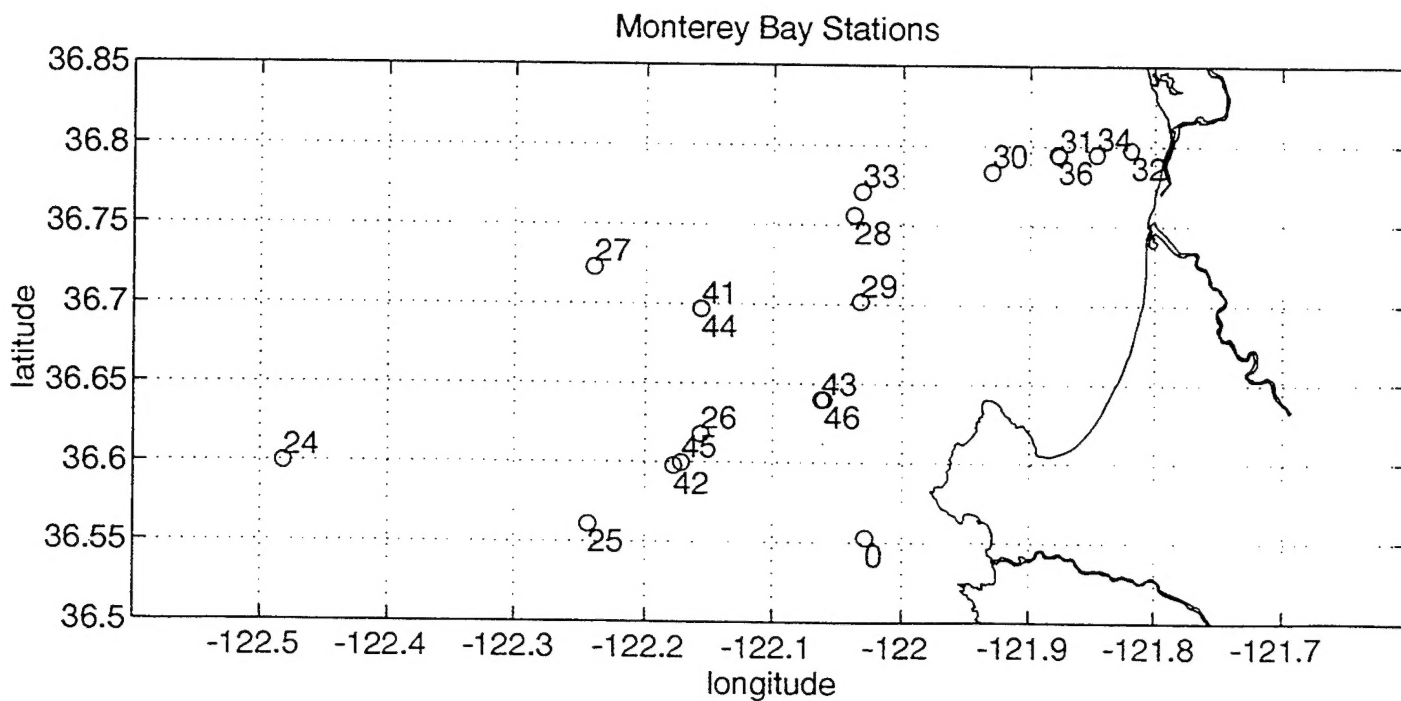

Figure 1b. CUC CTD station sites not on the POST.

Point Sur and the USNS DeSteiguer did not significantly deviate from these positions except insofar as weather conditions dictated. Hydrographic stations 1 through 18 were always occupied, while stations 19 through 22 were occupied as time and weather permitted (Table E1). Additionally, other hydrographic stations along the Monterey Submarine Canyon, in Carmel Bay, and in Monterey Bay (Figure 1b) were also occupied during each cruise as time and weather permitted. It should be noted that stations are more closely spaced near the coast than farther offshore (Figure 2). This was done to better resolve the current structure, which was anticipated to be relatively complex, over the shelf and slope regions.

3.0 Data Acquisition Equipment and Procedures

For all the cruises of the CUC program, hydrographic data were collected using Neil Brown Instrument Systems MK-IIIb CTDs (conductivity-temperature-depth) equipped with 0 to 6400 dbar pressure sensors. At each station, data were acquired (at a sampling rate of 32 Hz) during both the downcast and the upcast, although only the downcast data were ultimately used for the final results. At each station, the CTD was lowered through the thermocline (between 50 and 150 m, depending on the particular CUC station) at a speed of about 0.5 m-s^{-1} , and thereafter to the bottom at a speed of about 1.0 m-s^{-1} . At all stations, a General Oceanics (GO) rosette sampler was attached to the CTD and was equipped with up to 12 5-liter Niskin bottles for *in situ* water sampling. A minimum of two water samples-- one at the deepest depth of the cast and one near the surface-- was collected during the upcast at each station for salinity calibration. Additionally, water samples were usually also collected during the upcasts at depths of 1000 and 3000 m (where possible), also for salinity calibration. Finally, during all but the last cruise (April 1991), water samples from numerous other standard depths were also collected during the upcasts of approximately half the stations for chemical (e.g., oxygen) and biological analyses. All these water samples for salinity calibration were then analyzed in the laboratory immediately following each cruise using either a Guildline Autosol 8400B salinometer or an AGE Minisal salinometer. Prior to December 1990, the CTD data were acquired using an HP200 computer and were post-processed on an IBM 3033 mainframe computer at NPS using software developed internally at NPS. (For details, see Jessen, et al. [1989].) For the last three cruises of the CUC program, however, the CTD data were both acquired and post-processed on IBM-compatible computers using software developed for that purpose by EG&G, Inc. (EG&G Ocean Products, 1989).

Figure 2. Nominal CTD station spacing along the POST.

4.0 Calibration Procedures

The CTD pressure and temperature sensors were calibrated shortly before and after each cruise. Because of its stability, however, the conductivity sensor was calibrated before and after only about half the cruises. When the conductivity sensor was not calibrated, its most recent calibration coefficients were used for any given cruise. However, salinities calculated from CTD conductivities were always calibrated after each cruise by comparison with *in situ* salinities of water samples collected during each cruise. Pressure and temperature (and conductivity, where applicable) calibration coefficients obtained from the pre-cruise calibrations were generally the values used for acquisition and post-processing of the hydrographic data, unless there were compelling reasons to do otherwise. The calibration coefficients used during the CUC program are tabulated in Appendix D.

4.0.1 Pressure

The pressure calibration was carried out using a Chandler Engineering deadweight tester as a standard. Indicated pressures from the standard and the CTD sensor were recorded at approximately equally spaced pressures from 0 to 5000 dbar. A regression analysis was performed fitting the CTD pressures to the standard pressures, which yielded a linear fit (slope and intercept). This linear fit was applied during the acquisition of the hydrographic data. During post-processing of the hydrographic data, an additional adjustment to the pressure data was applied: the CTD pressure offset at the beginning of each cast was used as the final intercept. The calibration coefficients for pressure during the CUC program are given in Appendix D.

4.0.2 Temperature

The temperature calibration was done using a Sea-Bird SBE3 temperature sensor as a standard. This standard sensor is recalibrated by the manufacturer approximately every six months. A temperature bath of 70 to 80 liters of fresh water in an insulated tub was used to compare the standard and CTD sensors at 1° increments from 0° to 20° Celsius. Thirty data points were collected at each temperature and then averaged to yield a single calibration point for each temperature. A regression analysis was performed on the 21 calibration points, which yielded a linear fit (slope and intercept). The calibration coefficients for temperature during the CUC program are given in Appendix D.

4.0.3 Conductivity

At the beginning of the CUC program, the conductivity calibration was done using water samples analyzed by a Guildline 8400B Autosol salinometer as standards. Later, a Neil Brown Conductivity Salinity Adaptor CSA 1250 conductivity cell was used as a standard (with water samples analyzed by the 8400B Autosol used to doublecheck the calibration of the conductivity cell). Five saltwater baths of 70 to 80 liters with salinities ranging from about 15 mmho-cm⁻¹ to about 55 mmho-cm⁻¹ are maintained at room temperature. Indicated conductivities from the standard-- either water samples from each bath or conductivity cell values-- and from the CTD sensor were recorded for each water bath. Regressions were then performed fitting the CTD conductivities to the standard, which yielded a linear fit (slope and intercept). This linear fit was applied during the acquisition of the hydrographic data. Because the conductivity calibration of the CTD varies very slowly over time, it was not done before and after every cruise of the CUC program. The calibration coefficients for conductivity during the CUC program are given in Appendix D.

4.0.4 Salinity

In situ water samples were used to adjust final salinity values for each cruise. Usually, a straightforward procedure similar to that used for the pressure and temperature calibrations was used. However, because of a conductivity sensor fault, a more complicated two-step procedure was required for salinity calibration of six of the early cruises of the project. For the simpler, straightforward salinity calibration procedure, the CTD pressure, temperature, and conductivity were recorded as each water sample was collected. These numbers, after applying the appropriate calibration coefficients (Appendix D), were used to calculate salinity and the results compared with the water sample salinities determined in the laboratory after each cruise using a Guildline 8400B Autosol salinometer or an AGE Minisal salinometer. The mean and standard deviation of the differences between the CTD salinities and water sample salinities were calculated. Data points greater than two standard deviations from the mean were discarded. The mean of the remaining salinity differences was then calculated and subtracted (as an offset) from the CTD salinities. A regression was then run on the "offset-corrected" data, yielding a linear relationship (slope and intercept). The comparisons of the water sample salinities with the CTD salinities is given in Appendix C2.

In addition to the standard procedure above, an

additional step was required for the salinity calibration of the CTD during some of the early cruises of the project. It was discovered that one of the CTDs used during the CUC project had a defective conductivity cell which produced larger errors as the ambient pressure was increased. An additional initial step, therefore, was required in these cases to remove the pressure effect. It was found that a second-order polynomial fit between the salinity differences (between the collected water sample and the instrument observed salinities) and the pressures at which the water samples were collected could be used to model the pressure dependence of the sensor. Fitted salinity differences were computed from the polynomials and added to the instrument salinities, removing the pressure effect. Thereafter, the salinity calibration proceeded in the standard method described above, with an offset being determined and subtracted from the data followed by a regression being run on the "offset-corrected" data to yield a linear fit (slope and intercept). The coefficients of the second-order polynomial fit are given in Appendix C1; the standard comparisons of the water sample salinities with the "pressure corrected" CTD salinities are given in Appendix C2. A more extensive discussion of the removal of the CTD pressure dependence effect can be found in Tisch (1990).

5.0 Data Processing

(Although the actual hardware and software changed after the November 1990 cruise, the CTD data processing methods used were, if not identical, similar both before and after December 1990. For a detailed description of the data processing software and methods used during the CUC program prior to December 1990, see Jessen, et al. [1989]. For a more detailed description of the processing software and its use after December 1990, see EG&G Ocean Products, 1989.)

Raw CTD data were processed on a PC-compatible computer system. The software (EG&G Ocean Products, 1989) automatically flags suspicious pressure, temperature, and conductivity data based on user-specified first differencing criteria, and allows the user to examine and interpolate across flagged data as necessary. After the elimination through interpolation of any bad data, salinity was calculated from corrected values of pressure, temperature, and conductivity according to the algorithm of Lewis and Perkin (1981) and utilizing a dual time lag filter to remove time lag spikes. The data were then averaged to 2 dbar. The final salinity corrections (as described above) were then applied. The data tables provided in Section 9 are derived from 10-meter block averages of the final 2-meter data set.

6.0 Presentation of the Data

Stations 1 through 18 were closely spaced along $36^{\circ} 20' N$ for a distance of approximately 101 km. Stations 18 through 22 extended an additional 125 km along CalCOFI line 67, which is oriented at an angle to the near-shore segment of the transection (Figure 1a). Figure 2 shows the nominal spacing of the stations along $36^{\circ} 20' N$ and CalCOFI Line 67. Finally, a few stations in Monterey Bay and a single station in Carmel Bay were also sampled (Figure 1b).

Most stations were visited approximately six times per year from April 1988 to April 1991, except that the CUC transection was occupied twice during the April 1988 cruise. (The first occupation is referred to as April 1988A, the second as April 1988B.) Stations 1 through 18 were sampled on every cruise. Section 8.0.1 presents charts of the locations of the stations sampled during each cruise of the CUC project. Mean fields for the CUC hydrographic transection, including a mean temperature-salinity graph and a mean density anomaly-spiciness graph, are shown in section 8.0.2. Individual cruise hydrographic transections for temperature and salinity are given in section 8.0.3, and for density anomaly and spiciness in section 8.0.4. The individual hydrographic transections include the pertinent station locations. All the transections were constructed with a contouring grid which had 30 points horizontally and 50 vertically using program Plot Plus. This yielded grid intervals of less than 8 km horizontally and 80 dbars vertically.

Finally, temperature-salinity and density anomaly-spiciness plots are given for the individual cruises in sections 8.0.5 and 8.0.6, respectively.

7.0 Acknowledgements

This work was funded by the Naval Postgraduate School, with shiptime funding from the Oceanographer of the Navy. The authors wish to thank Mr. Paul Jessen for both his help at sea and his help in processing much of these data. We also wish to thank everyone who participated in the cruises, particularly Mr. Andy Anderson for his durability and seamanship. Finally, the able assistance of the masters and crews of the *USNS DeSteiguer* and the *R/V Point Sur* is much appreciated.

Table	Page
A Hydrographic Data Tables	145-415
<p>The data are presented by station in chronological order beginning with the CTD cast of 17 April 1988. The tables present pressure (dbar), temperature ($^{\circ}\text{C}$), salinity, potential density anomaly (kg-m^{-3}), specific volume ($10^{-8} \text{ m}^3\text{-kg}^{-1}$), dynamic height, and spiciness. Salinity is computed according to PSS-78, while spiciness is based upon an unpublished manuscript by Flament (1986).</p>	
B Personnel List	416-417
C1 CTD Salinity Calibrations: Removal of Pressure Dependence	418
C2 CTD Salinity Calibrations	419-420
D CTD Calibration Coefficients: Pressure, Temperature, Conductivity	421-422
E1 Cruise and Station List	423
E2 Cruise Dates and Vessel List	424

Appendix C1-- CTD Salinity Calibrations: Removal of Pressure Dependence

The NBIS MK-IIIB CTD serial number 5386 was found to have a faulty conductivity cell which produced larger instrument errors as ambient pressure increased. The faulty cell was not replaced until after the November 1989 cruise. A second order polynomial fit was used to model the conductivity cell's pressure dependence, which could then be removed from the CTD data. This table lists the coefficients of the second order fits used to remove the pressure dependence.

Cruise Date	Instrument Serial No.	Calibration Coefficients		
		$(a_2)x^2$	$(a_1)x$	(a_0)
Sep. 88	5386	-4.596×10^{-9}	-9.816×10^{-6}	-0.018
Nov. 88	5386	-4.385×10^{-9}	-8.975×10^{-6}	-0.015
Feb. 89 ^a	5386	-5.889×10^{-9}	-4.171×10^{-6}	-0.023
Feb. 89 ^b	5386	-1.031×10^{-8}	1.287×10^{-5}	-0.024
Mar. 89	5386	-7.542×10^{-9}	3.498×10^{-6}	-0.018

Appendix C2-- CTD Salinity Calibrations

After each cruise of the CUC program, CTD salinities (calculated from the corrected pressure, temperature, and conductivity readings) were compared to water sample salinities (measured in the laboratory by a salinometer of samples collected at the same depths from which the CTD salinities were measured). The mean difference between the CTD and water sample salinities was determined and removed from the CTD data. A linear regression was then applied to fit the adjusted CTD salinity data to the water sample salinity data. This table lists the slope and intercept of that linear fit for each cruise of the CUC program. The actual CTD used, as well as the number of values that went into the fit and the standard deviation of the fit, are also listed for each cruise.

Appendix D-- CTD Calibration Coefficients: Pressure, Temperature, Conductivity

The following table lists for each cruise of the CUC program the actual instrument used and the corresponding calibration coefficients for the various CTD sensors. Pressure and temperature sensors were always calibrated before and after each cruise. Because of its stability, the conductivity sensor was not always calibrated in this manner. However, salinities calculated from the CTD conductivities were always calibrated after each cruise by comparison with *in situ* salinities of water samples collected during the cruise.

*3: Use the conductivity coefficients from September 1989.

*4: Use the conductivity coefficients from December 1990.

APPENDIX E1-- Cruise and Station List

This table lists the CTD stations and the cruises during which they were sampled. Details of the station position are listed on the left. On the right, cruise numbers from 1 to 20 head the columns. For each cruise, the "+" signs indicate which stations were sampled.

Stations 1 through 22 comprise the CUC transection, which follows latitude line 36°20'N from the shore to station 18, then bends to follow the CalCoFi line 67. For the CUC transection, the distance column shows the distance between the station and the shore measured along the transection. The lower portion of the table shows stations in and about Monterey Bay. Note that there is no cruise 14.

APPENDIX E2-- Cruise Dates and Vessel List

This table lists the CUC cruises with inclusive dates and research vessels used. Note that there is no cruise 14.

Cruise	Cruise Dates	Vessel
CUC01	15 April - 1 May 1988	USNS DeSteiguer
CUC02	3 August - 8 August 1988	R/V Point Sur
CUC03	22 September - 27 September 1988	R/V Point Sur
CUC04	14 November - 19 November 1988	R/V Point Sur
CUC05	2 February - 7 February 1989	R/V Point Sur
CUC06	25 March - 30 March 1989	R/V Point Sur
CUC07	10 May - 26 May 1989	USNS DeSteiguer
CUC08	28 July - 3 August 1989	R/V Point Sur
CUC09	25 September - 30 September 1989	R/V Point Sur
CUC10	15 November - 22 November 1989	R/V Point Sur
CUC11	17 January - 24 January 1990	R/V Point Sur
CUC12	19 March - 26 March 1990	R/V Point Sur
CUC13	17 May - 23 May 1990	R/V Point Sur
CUC15	16 June - 22 June 1990	R/V Point Sur
CUC16	13 August - 19 August 1990	R/V Point Sur
CUC17	18 October - 1 November 1990	USNS DeSteiguer
CUC18	12 December - 19 December 1990	R/V Point Sur
CUC19	12 February - 27 February 1991	R/V Point Sur
CUC20	5 April - 11 April 1991	R/V Point Sur

11.0 Initial Distribution List

1. Naval Postgraduate School
Department of Oceanography
Monterey, CA 93943

Dr. Curtis A. Collins 1
Dr. Newell Garfield 1
Mr. Thomas A. Rago 1
Mr. John Locke 1
2. Dean of Research 1
Naval Postgraduate School
Monterey, CA 93943
3. Dudley Knox Library (Code 013) 2
Naval Postgraduate School
Monterey, CA 93943
4. Monterey Bay Aquarium Research Institute
P.O. Box 628
Moss Landing, CA 95039-0628

Dr. Francisco Chavez 1
Mr. Gernot Friederich 1
5. Dr. Frank Schwing 1
Pacific Fisheries Environmental Group
1352 Lighthouse Avenue
Pacific Grove, CA 93950
6. Maury Library 1
NavOceano
1002 Balch Boulevard
Stennis Space Center, MS 39529
7. Dr. Marlene Noble 1
United States Geological Survey
345 Middlefield Road
Menlo Park, CA 94025
8. Defense Technical Information Center 2
8725 John J. Kingman Road, STE 0944
Fort Belvoir, VA 22060-6218
9. Dr. Lou Codispotti 1
The Center for Coastal Physical Oceanography
Old Dominion University
Crittenton Hall, 768 52nd Street
Norfolk, VA 23529
